BRP ROADING SOLUTION

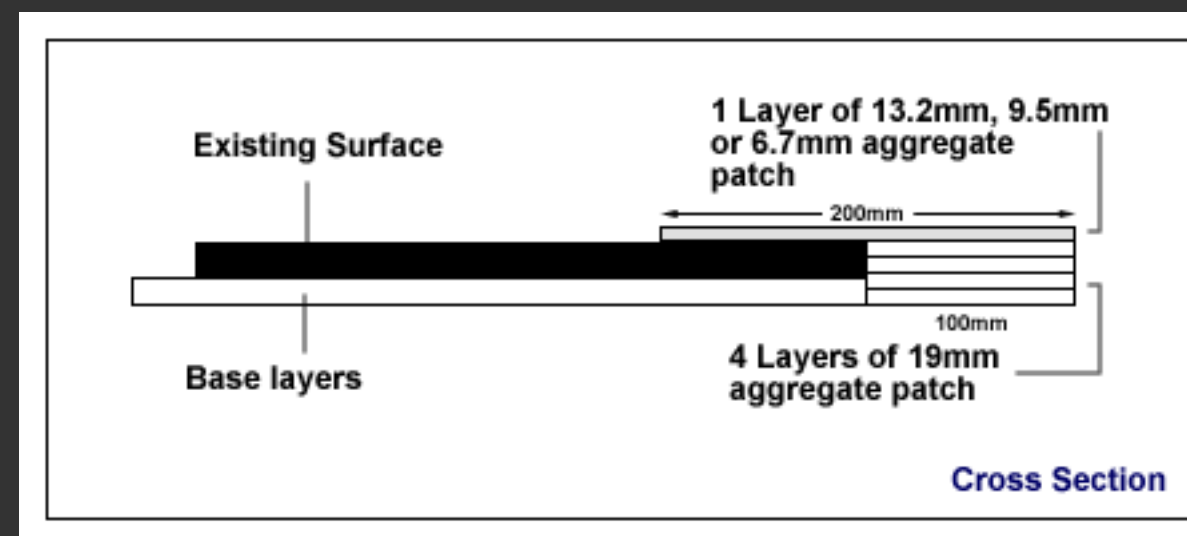

[BACK](#)

[NEXT](#)

THICKENED EDGE

Thickened edges are utilised to protect carriageway edges, by means of a flexible interface between different materials. Durable, quick to install BRP Road Patch also provides a water resistant layer.

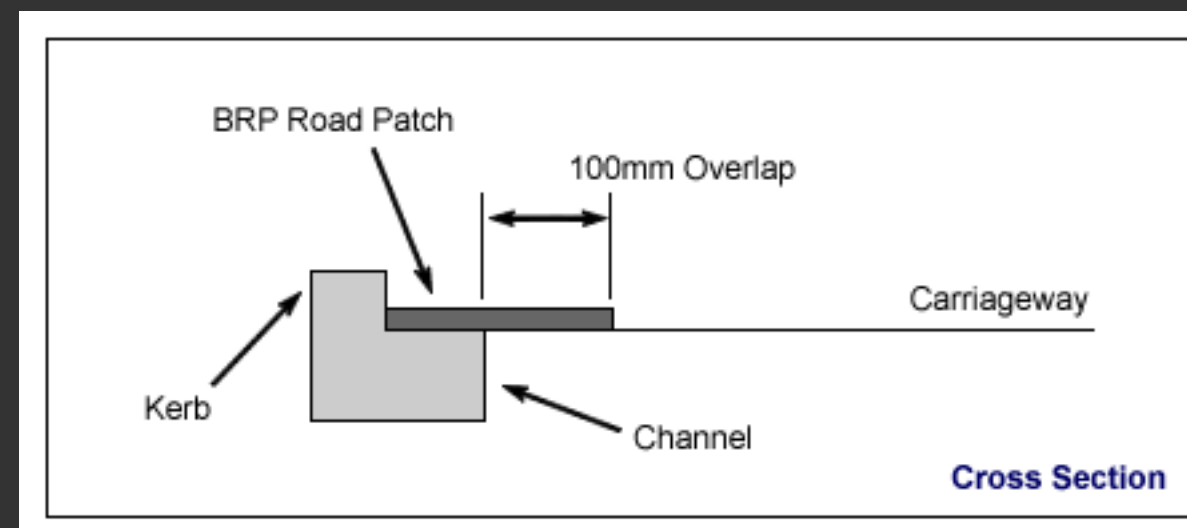

CHANNEL REPAIRS

In situations where channels crack and distort, replacement of the concrete channel often results in disturbance to the adjacent base layers. To obviate this situation, the procedure would firstly be to defoliate. Secondly, install BRP Road Patch over the existing channel ensuring a 100mm overlap on the carriageway and flush with the kerb.

Additional Advantages

- BRP Road Patch adheres to concrete and compacted gravel as well as asphalt.
- The removal of damaged concrete is unnecessary.
